

Breathe Easy: A Comprehensive Guide to Respirator Fit Testing

- Stephanie Lynch, PhD, CIH, CSP

- Luke Allen

- Hunter Strickler

- October 2024

What is a **Respirator Fit Test**?

The use of a protocol to evaluate the fit of a respirator on an individual

Verifies training and identifies the specific make, model, style, and size of respirator best suited for each employee

Why **Fit Test**?

**Health & Safety
Executive**

- Protect the health of employees
- Ensure employees are trained on their mask and their risk
- Provide employees peace of mind
- Required by:
 - OSHA 29 CFR 1910.134
 - ANSI Z88.10 – 2010
 - ISO 16975 – 2017
 - HSE INDG479
 - INRS ED 6273
 - AS/NZS 1715

Who Can **Fit** Test?

- Competent Individual?
- Qualified Individual?
- Program Administrator?
- Anyone?

Accreditation Schemes

-
-
-
-

How About a Repeat Test?

When the wearer:

- Loses or gains significant weight (+/- 20lbs or 9kg)
- Undergoes any substantial dental work
- Develops any facial changes (scars, moles, etc.) around the face seal area
- At the regulated time interval (typically annually)

Qualitative Fit Testing (QLFT)

Relies on the wearer to detect leakage

Pass/Fail Test

Typically limited to half mask respirators

Quantitative Fit Testing (QNFT)

Uses a machine to measure leakage

Provides a fit factor

Can be used on any respirator

Two Most Common Methods of QNFT:

CNP

- OHD Quantifit & QuantiFit2
- Air is the challenge agent
- Carried out by replacing filters with fit test adapters
- Uses a Controlled Negative Pressure to directly measure respirator leakage
-
-
-

Ambient Aerosol CNC

- OHD AeroFit
- Aerosol is the challenge agent
- Carried out by probing the respirator
- Calculates the ratio of external particles to the particles in the mask

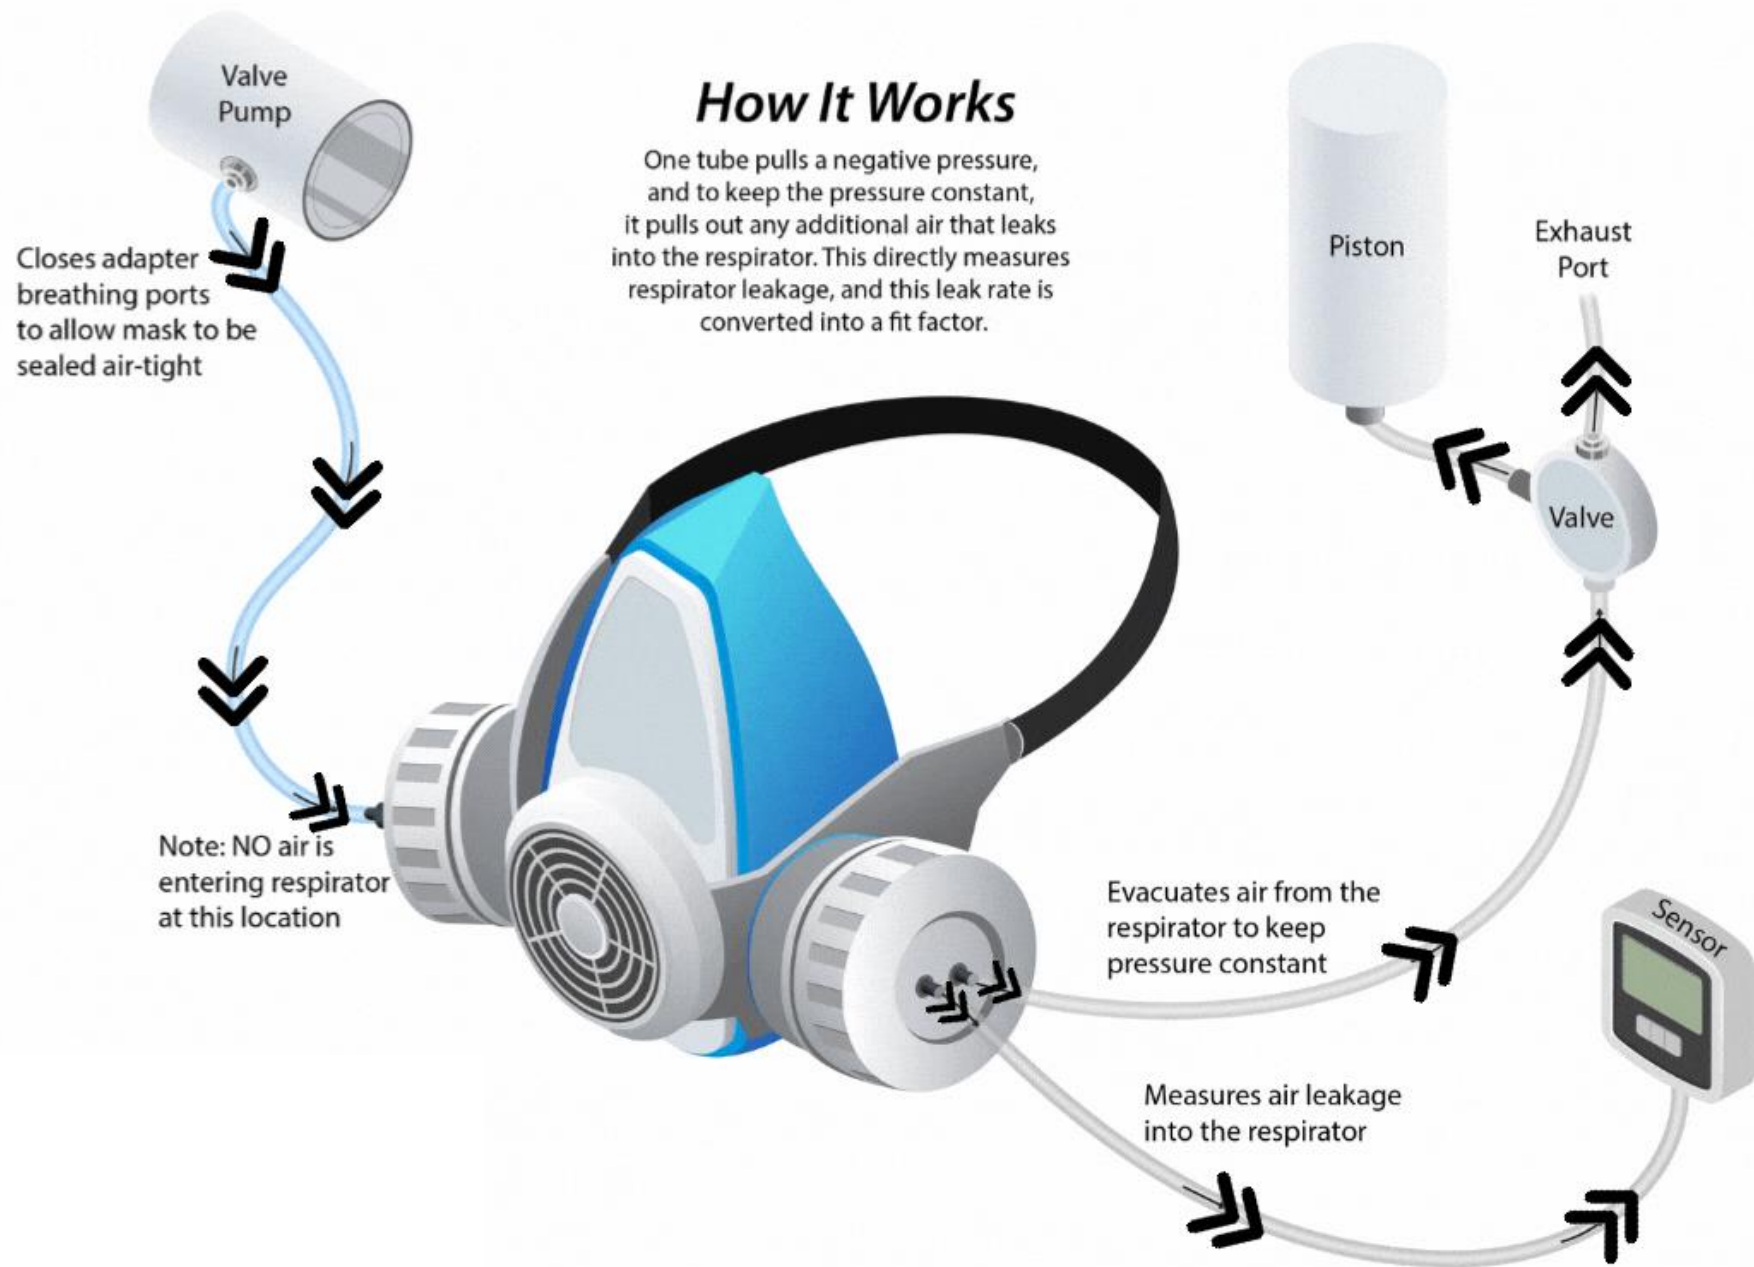

Controlled Negative Pressure

- Uses Controlled Negative Pressure technology directly related to a scientifically validated modelled breathing rate to measure respirator leakage.
- Respirator must be equipped with fit test adapters.
- The idea is that once a controlled pressure is achieved within the respirator facepiece, any air that is removed is the result of leakage.
- CNP precisely measures leak rate in cc/min after a series of exercises.
- The ratio of this leak rate to the modelled breathing rate is the Fit Factor.

How It Works

One tube pulls a negative pressure, and to keep the pressure constant, it pulls out any additional air that leaks into the respirator. This directly measures respirator leakage, and this leak rate is converted into a fit factor.

Benefits

- No Environmental Requirements
- Highly Portable
- Battery power

Limitations

- Cannot fit test Filtering Facepiece Respirators

Condensation Nuclei Counting

- Uses laser technology to measure aerosol concentrations inside and outside the respirator.
- Respirator must be equipped with high efficiency filters.
- The idea is that because few particles penetrate a high efficiency filter, any found inside the respirator can be attributed to face seal leakage.
- Measures the concentration of particular particulates in the respirator while the test subject is performing a series of exercises.
- The ratio of this concentration in the breathing zone to the ambient particulate concentration is the Fit Factor.

Ambient

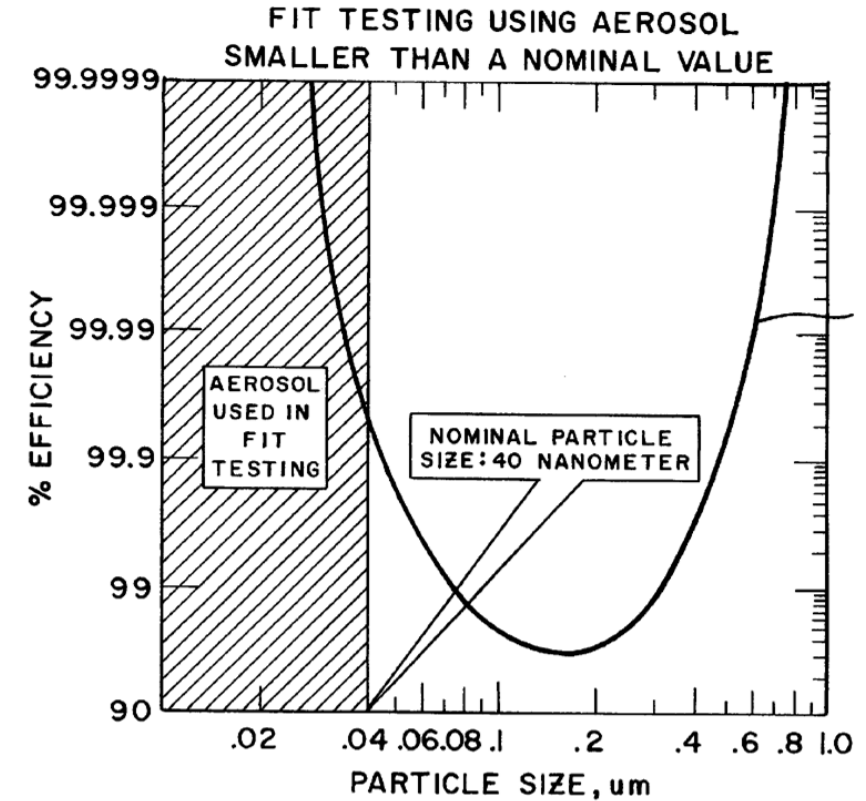

Ambient

Mask

N95/DMA Explanation

Minimum filter efficiency	N series	R series	P series
	Not resistant to oil	Somewhat resistant to oil	Strongly resistant to oil
95%	N95	R95	P95
99%	N99	R99	P99
100% (99.97%)	N100	R100	P100

— CNC/APC

Benefits

Can fit test any tight-fitting respirator

Limitations

Environmental requirements

Consumables

Test Subject should not eat or smoke for 30 minutes before testing

Overall **Fit** Factor =

$$N / [1/FF1 + 1/FF2 + \dots + 1/FFN]$$

Where:

N = The number of exercises;

FF1 = The fit factor for the first exercise;

FF2 = The fit factor of the second exercise;

FFN = The fit factor of the Nth Exercise.

Latest Advancements in Respirator Fit Testing

AeroFit Built in Zero Port

QuantiFit2 - Integrated Valve Prop Adapters

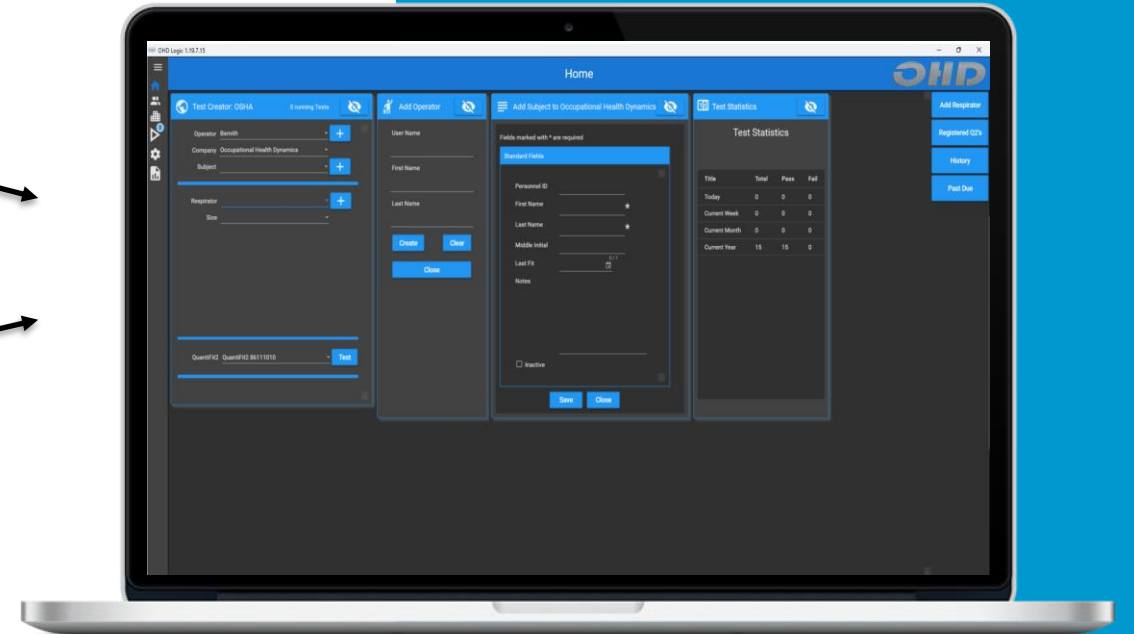

- **Convenience:** Eliminates the need to use and keep track of separate, small valve props
- **Speed & Efficiency:** Reduces setup time for fit testing
- **Consistency:** Ensures consistent, repeatable results in fit testing by standardizing the valve propping process

QuantiFit2 and AeroFit

- Can operate in stand-alone mode with virtually unlimited data storage or can operate through OHD Logic software.
- OHD Logic software can operate both the QuantiFit2 (CNP) and AeroFit (CNC) simultaneously out of one fit testing database.

The screenshot shows the OHD Manager Dashboard interface. The left sidebar contains navigation options: Admin, Dashboard, Personnel, Notifications, Conflicts, Instruments, Data Imports, and Reports. The main content area is titled "Manager Dashboard" and includes an "Overview" section with a table of metrics:

Metric	Count
Past Due	29
Due soon	25
Compliant	617
Calibration Due	2

Next to this table is a "Compliance Status" donut chart with a legend for Compliant (green), Due soon (yellow), and Past Due (red). Below the overview is a "Recent Imports" table:

Introducing: OHD Academy

- **How to Use the QuantiFit2** course has received early 5-star reviews
- Designed for *individual* (not group) training for new Q2 operators
- OHD registers each participant in the platform
- Certificate is issued upon completion

YOUR PROTECTION. OUR PRIORITY.

Which instrument is right for you?

Breathe Easy

With the launch of AeroFit, OHD will be the only respirator fit testing manufacturer with both CNC and CNP technologies.

YOUR PROTECTION. OUR PRIORITY.
